3-C+E by District and Day for 2011-2026 (https://mcusercontent.com/758ca84e9c44c25b4123ada30/files/38f49812-1d03-fd85-b066-b486e5c5e778/HistoricalCEandPMTF.20.pdf?mc_cid=b77da7fb07&mc_eid=UNIQID)

Good evening,

Today's weather was more conducive to fishing, and the Daily Catch Index regained some strength after a couple of rough weather days. Assuming an 8 to 9 day travel time, we estimate that 50% of C+E should reach the inshore districts around July 2-3, which would put the total run at 41 to 47 million.

Taking today's stock composition into account, our current interpretation is that the Nushagak and Egegik Districts should build over the coming days before tapering off, while the Naknek-Kvichak District continues to strengthen at least through July 5.

PMTF Stock Composition Status: The stock composition for June 30-July 1 should be released 7/2 or 7/3.

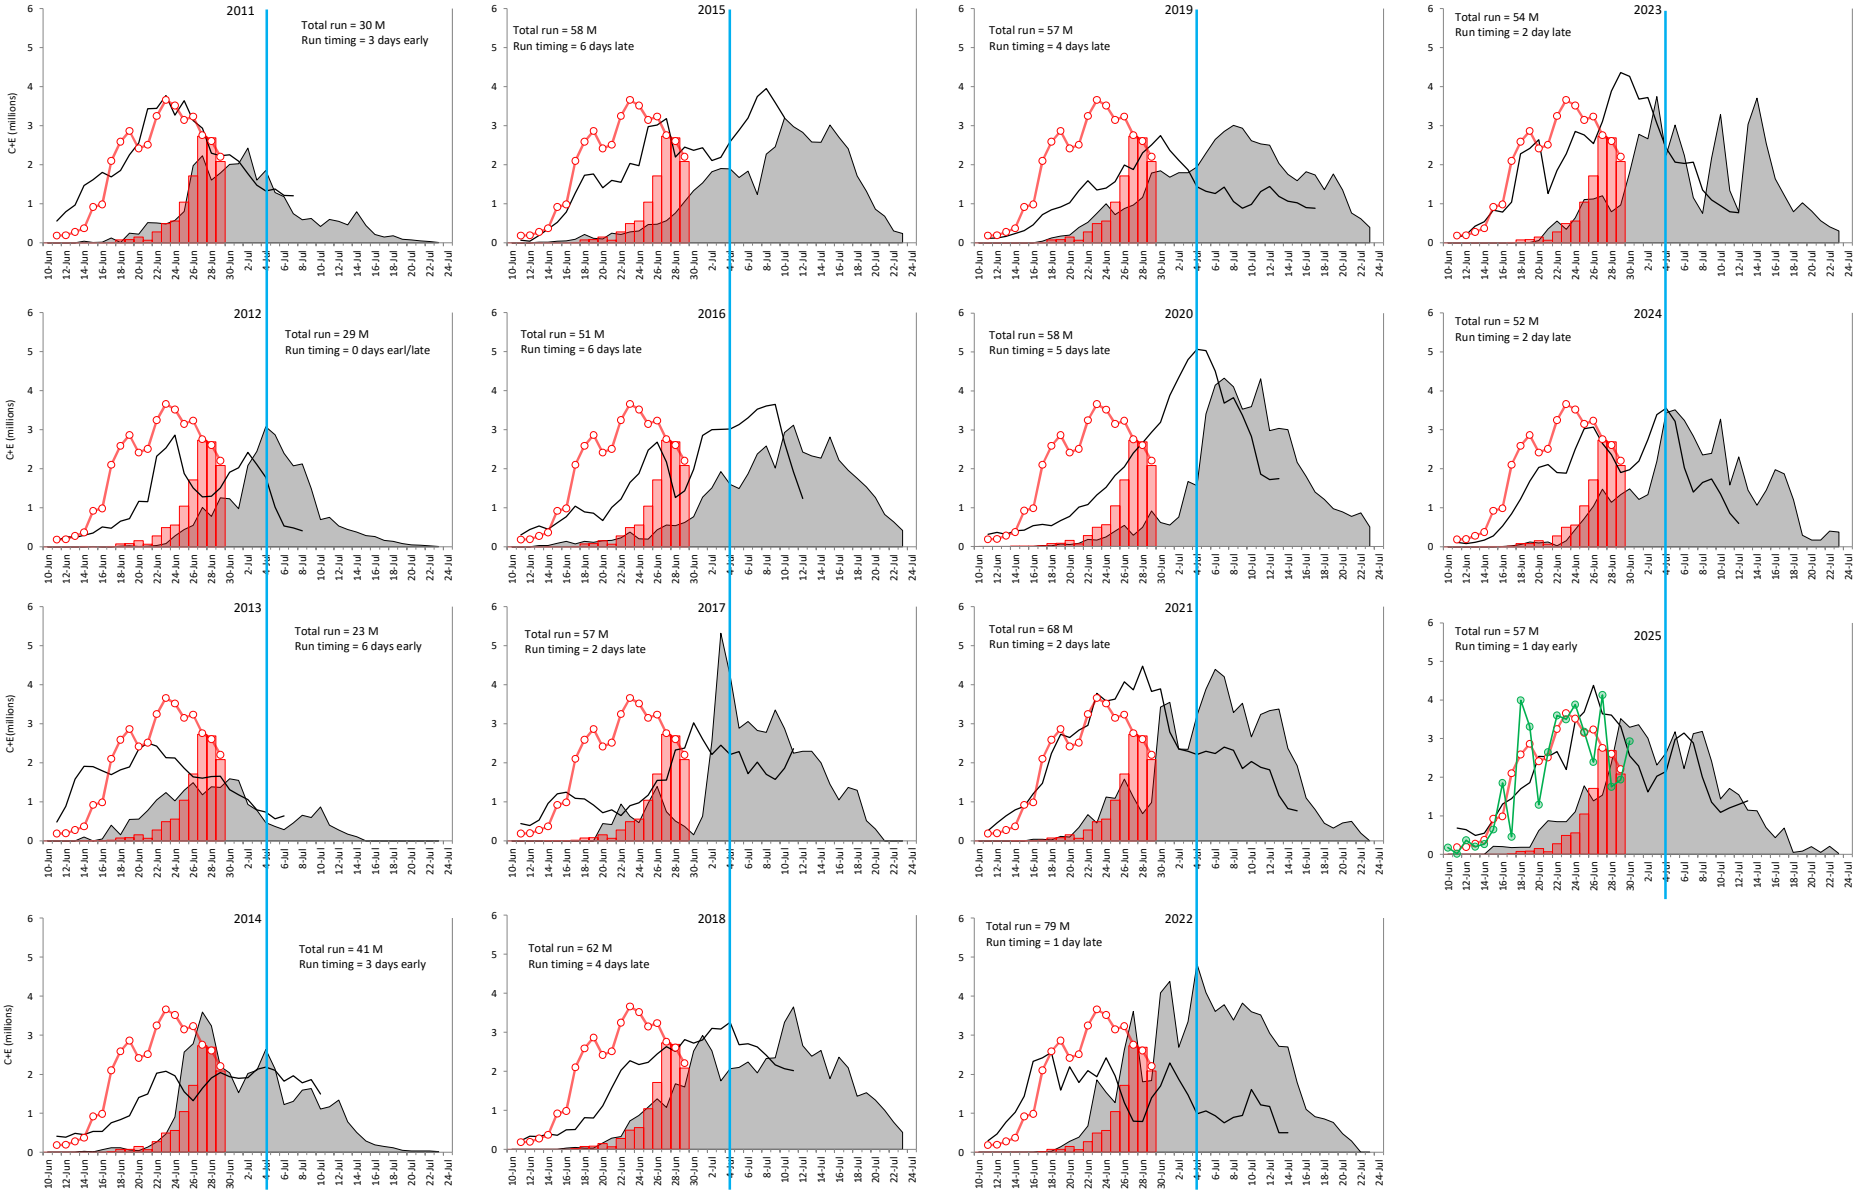
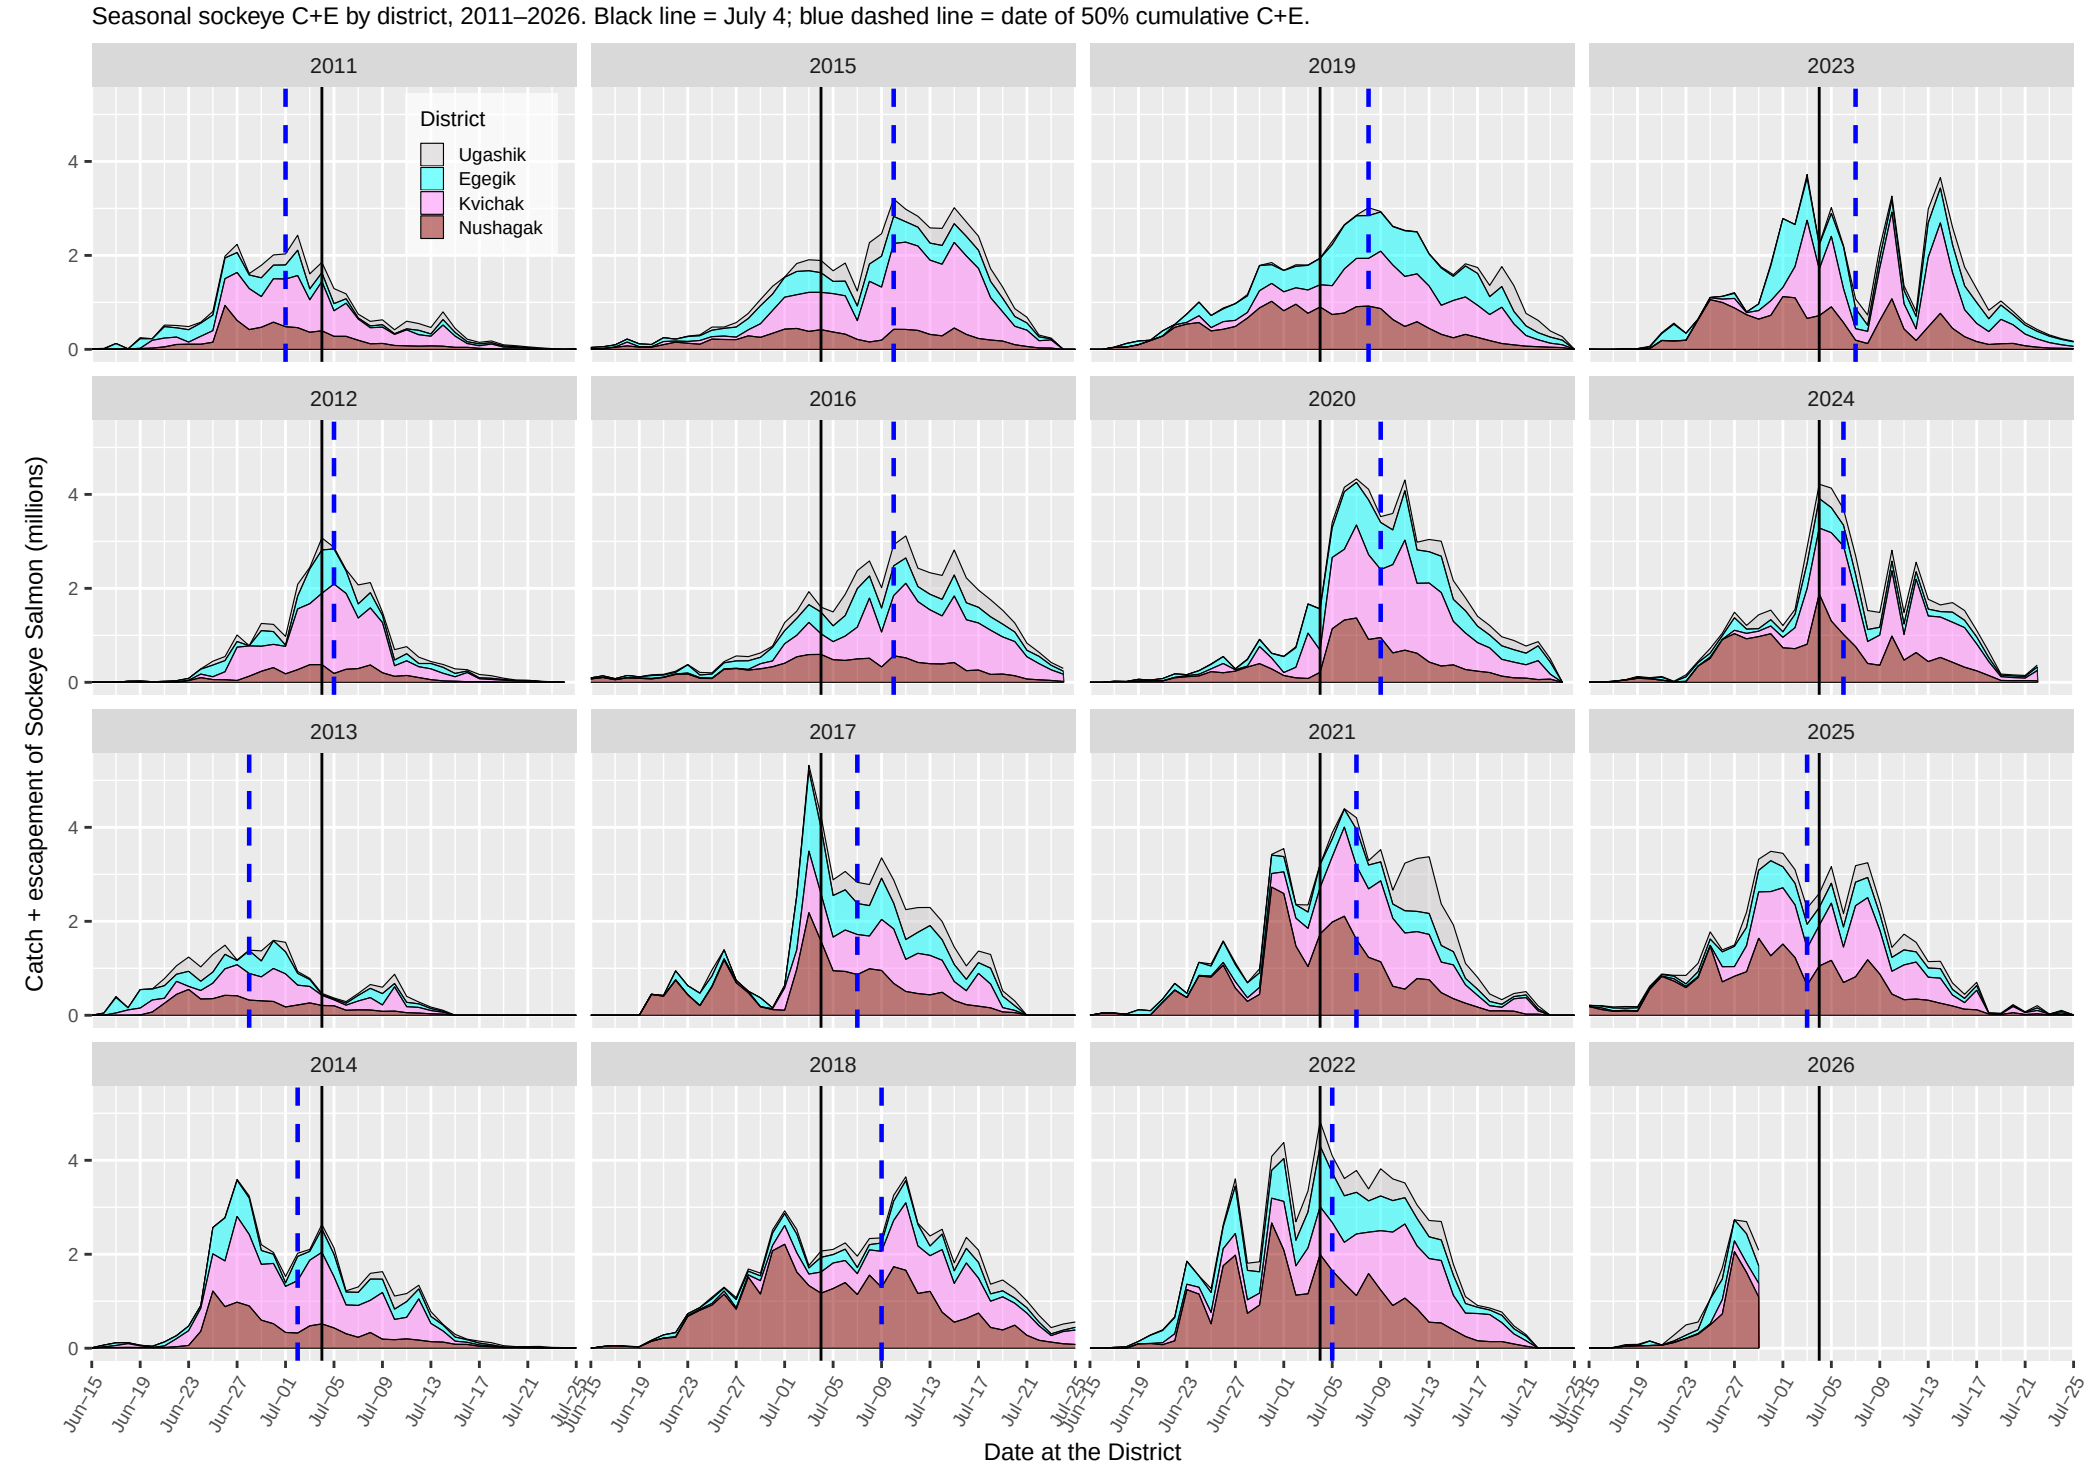
PMTF Daily Index and inshore catch + escapement (C+E) for 2011-2026. Gray area curve = observed C+E for historical years scaled to the left vertical axis; red columns = observed C+E for 2026. Black lines = respective Daily PMTF Catch Indices for each historical year; the red line = a 3-day moving average of the Daily Catch Index for 2026 based on Stations 2-24 (units for the daily indices are not shown, but all graphs are scaled the same). The green line shown for the 2025 panel reflects the 2026 Daily Catch Index without a moving average. Catch Indices for years prior to 2018 represent the average catch-per-unit-effort (CPUE) across Stations 2-10. Furthermore, a shallower net (6 m deep) was used during 2011-2019; beginning in 2020 the net depth has been 11 m deep. Run timing for C+E was estimated by comparing each year's date when 50% of the run reached inshore to July 4. Blue vertical lines highlight July 4 for reference.





Seasonal sockeye C+E by district, 2011–2026. Black line = July 4; blue dashed line = date of 50% cumulative C+E.
